DETAILED ACTION

1. This office action is responsive to request for reconsideration filed on 2/13/2004.

Claim Rejections - 35 USC § 103

2. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

3. Claims 1-15 are rejected under 35 U.S.C. 103(a) as being unpatentable over the prior art figures 1-5, cited by Applicant

Regarding claims 1, 6, and 11, the prior art Fig. 5 teaches a method for driving a segmented pi-cell modulator in a stereoscopic image viewing system, comprising applying an alternating carrier waveform to the pi-cell (col. 5, lines 28-44, col. 12, lines 33-68).

The prior art Fig. 5 differs from claims 1, 6, and 11 in that it does not specifically teach the waveform is unipolar-carrier, which does not change polarity within a time period that the pi-cell is energized. The prior art Fig. 5 teaches alternating polarity carrier waveform. However, it well known in the art whether to use alternating unipolar carrier or alternating polarity carrier would have been within the knowledge of the person of ordinary skill and would have been obvious and engineering design choice. Therefore, it would have been obvious to obtain the waveform is alternating, unipolar in order to prevent a visible artifact and reduce the appearance of ion migration defects.

Regarding claims 2, 7, and 12, the prior art Fig. 2 teaches the waveform is in the range of 1-2 kHz (in the specification page 4, lines 10-12).

Art Unit: 2674

Regarding claims 3, 4, 8, 9, 13 and 14, the prior art Fig. 2 teaches a stutter start waveform is applied to the pi-cell for a brief period of time when power is first applied (in the specification page 2, lines 24-29).

Regarding claim 5, 10 and 15, although the prior art figures not specifically teach the small rest period is approximately a few hundred milliseconds. However, it would have been obvious to obtain small rest period is approximately a few hundred milliseconds in order to optimally activate the cell.

4. Applicant's arguments with respect to claims 1-15 have been considered but are moot in view of the new ground(s) of rejection.
